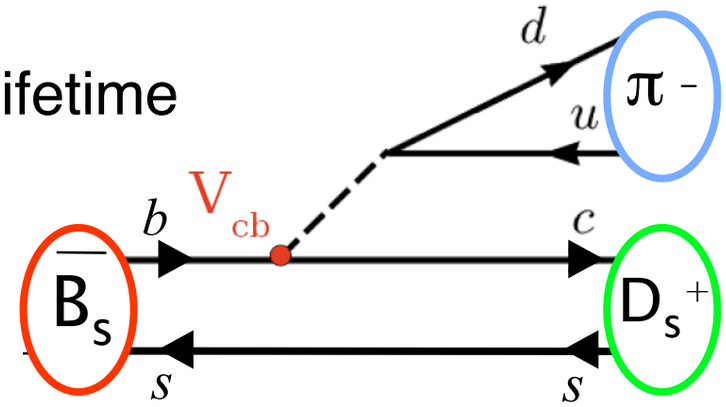
XLIIIrd Rencontres de MORIOND Electroweak Session
La Thuile, March 8, 2008

Motivation

Spectator model: *b* mesons and baryons have same lifetime

Pauli interference, weak annihilation, weak exchange predict lifetime ordering

$$\tau(B_c) < \tau(\Lambda_b) < \tau(B_s) \cong \tau(B^0) < \tau(B^+)$$



Experimental status:

	$\frac{\tau(B^+)}{\tau(B^0)}$	$\frac{\tau(B_s)}{\tau(B^0)}$	$\frac{\tau(\Lambda_b)}{\tau(B^0)}$
Theory	1.06±0.02	1.00±0.01	0.86±0.05
Exp.	1.071±0.009	0.939±0.021	0.921±0.036

$\tau(B_s)$

PDG (2007): 1.437 + 0.031 - 0.030 ps

DØ (2006): 1.398 ± 0.044 + 0.028 - 0.025 ps ← Included in PDG 2007

CDF II Hadronic (360 pb^{-1}): 1.60 ± 0.10 ± 0.02 ps

Tevatron experiments in great position to provide feedback to theorists on $\tau(B_s)$!

CDF II $J/\psi\phi$ (1.7 fb^{-1} - Aug 2007): 1.52 ± 0.04 ± 0.02 ps

Update hadronic measurement (today's subject)

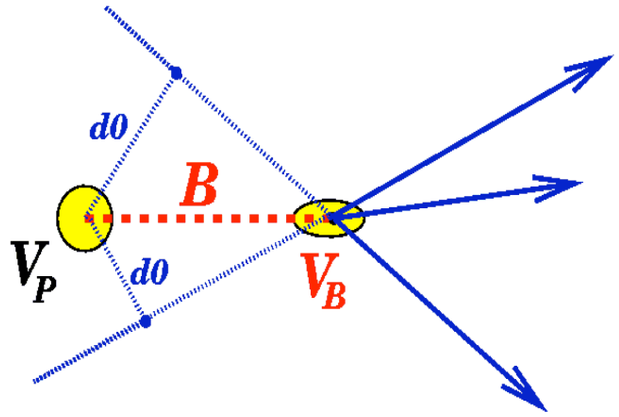
Hadronic Trigger Strategy

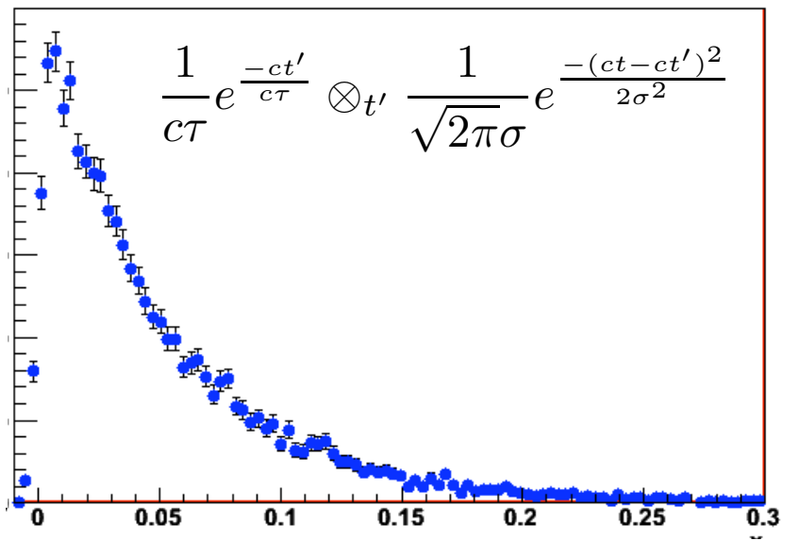
Decay mode of interest: $B_s \rightarrow D_s^- (\phi\pi^-)\pi^+$

Separating heavy B mesons from prompt backgrounds

- ✦Take advantage of long lifetime
- ✦Trigger on displaced vertex (> 200 μm)

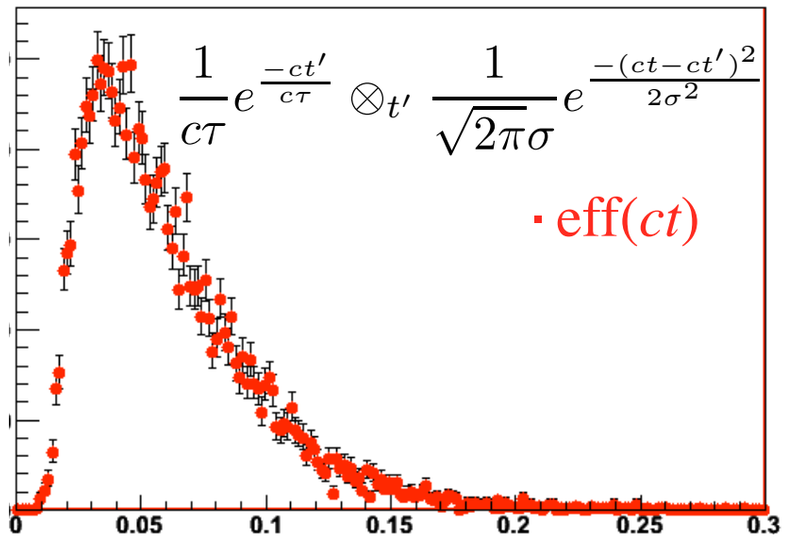
Strategy sculpts proper time distributions





Trigger Cuts

Analysis Cuts



Use Monte Carlo to derive "efficiency curve" parameters → fixed in final fit to data

$$\mathrm{eff}(ct) = \sum_{i=1}^{3} N_i \cdot (ct - \beta_i)^2 \cdot e^{\frac{-ct}{c\tau_i}} \quad \text{if} \quad ct > \beta_i$$

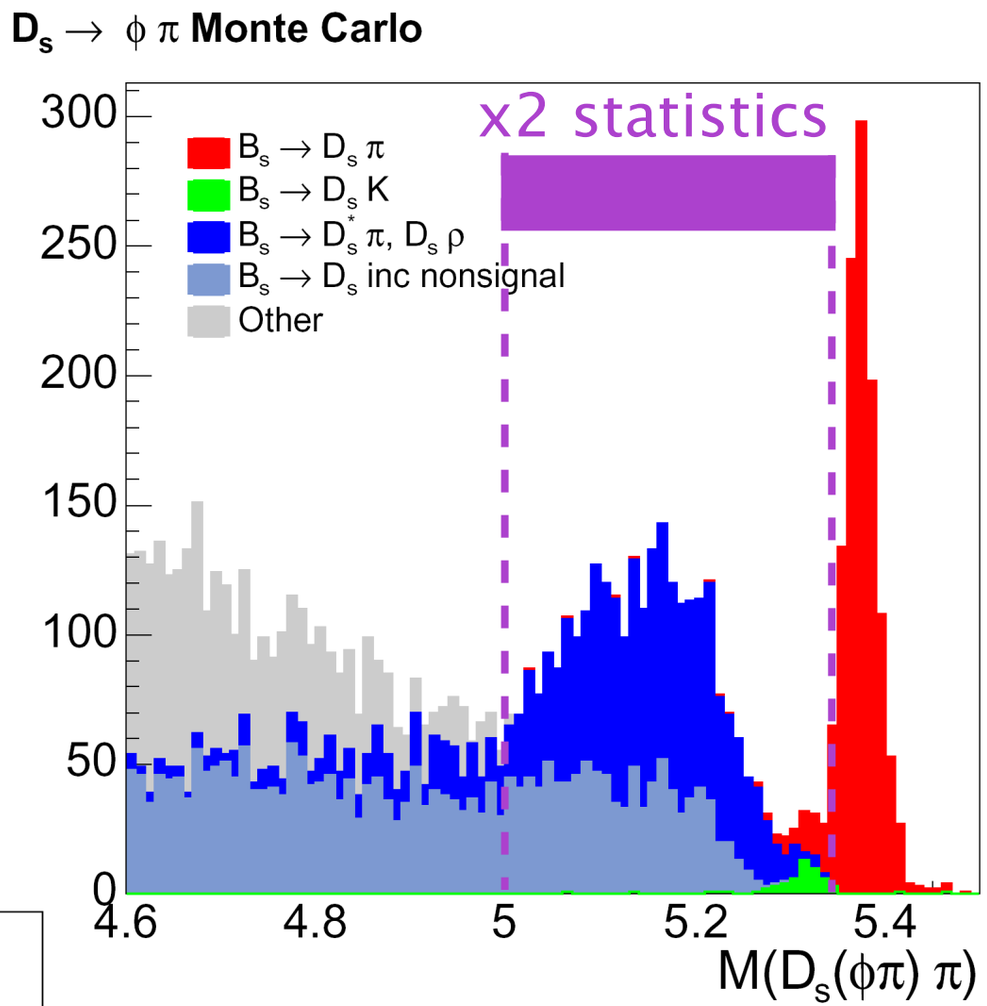
Partially Reconstructed Decays

Goal: Decrease statistical error (increase statistics)

1. Include more luminosity (360 pb^{-1} →1.3 fb^{-1})
2. Use partially reconstructed decays

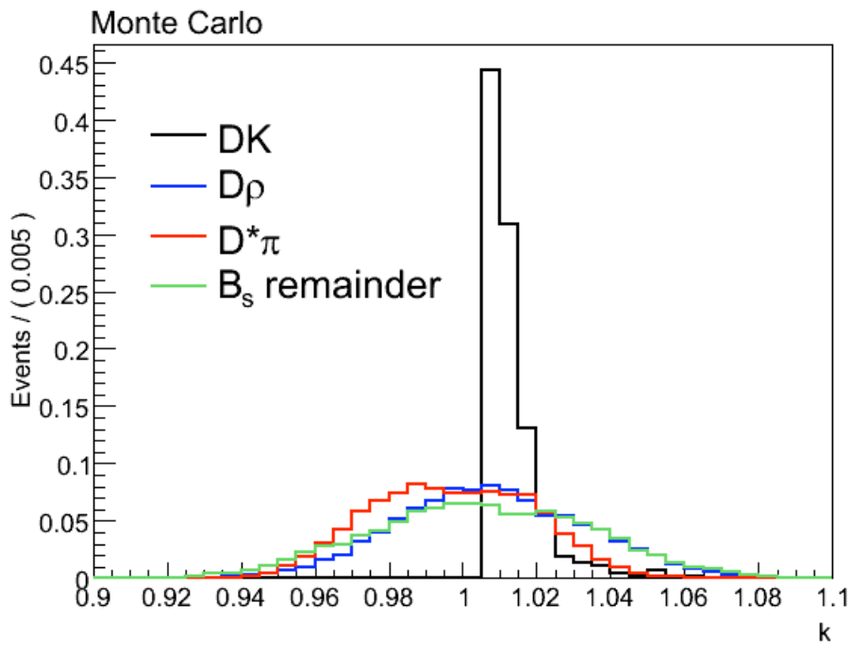
$B_s \rightarrow D_s^- (\phi\pi^-)\pi^+$ sample includes partially reconstructed decays

- ✦ tracks not reconstructed or wrong mass assignment
- ✦ doubles the statistics!



Corrective "K" factor accounts for missing momentum and mass

$$ct = \frac{L_{xy} \cdot m_B^{rec}}{p_T} \cdot K$$



- ✦ Good agreement with world averages
- ✦ Good agreement between FR and PR regions

Procedure tested extensively in 3 control samples

$B_s \rightarrow D_s^- (\phi\pi^-)X$ Measurement

Procedure

1. Perform mass fit to set fractions of modes
2. Fix fractions in lifetime fit. Fit for $c\tau(B_s)$ only

Largest systematic = background composition

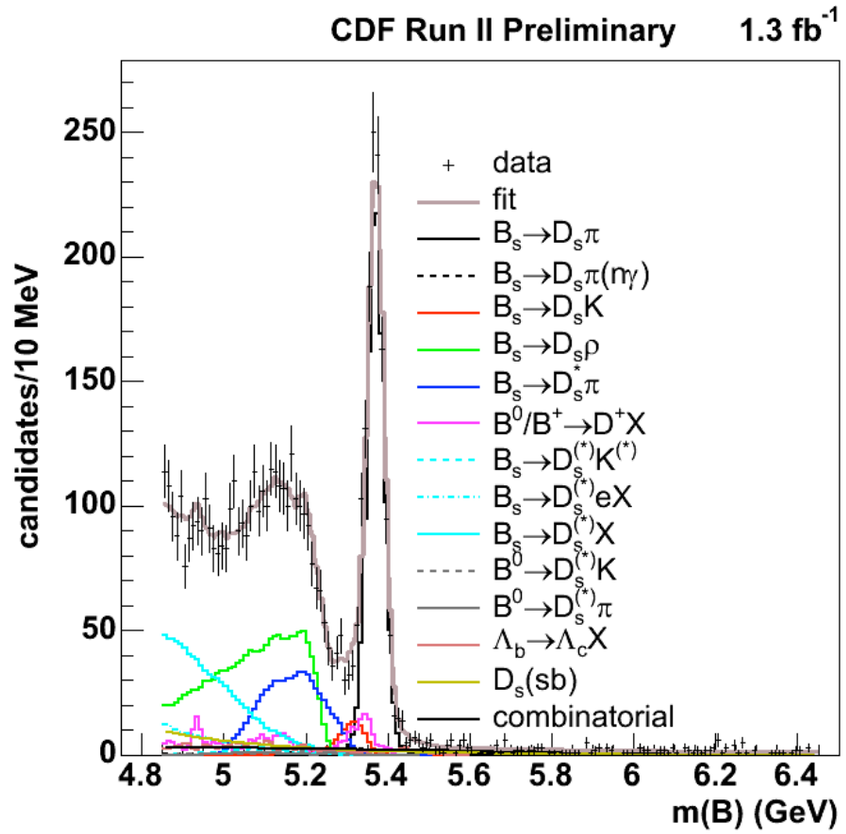
- ✦ promptly produced D + track ?
- ✦ tracks from real b hadron ?
- ✦ background fraction

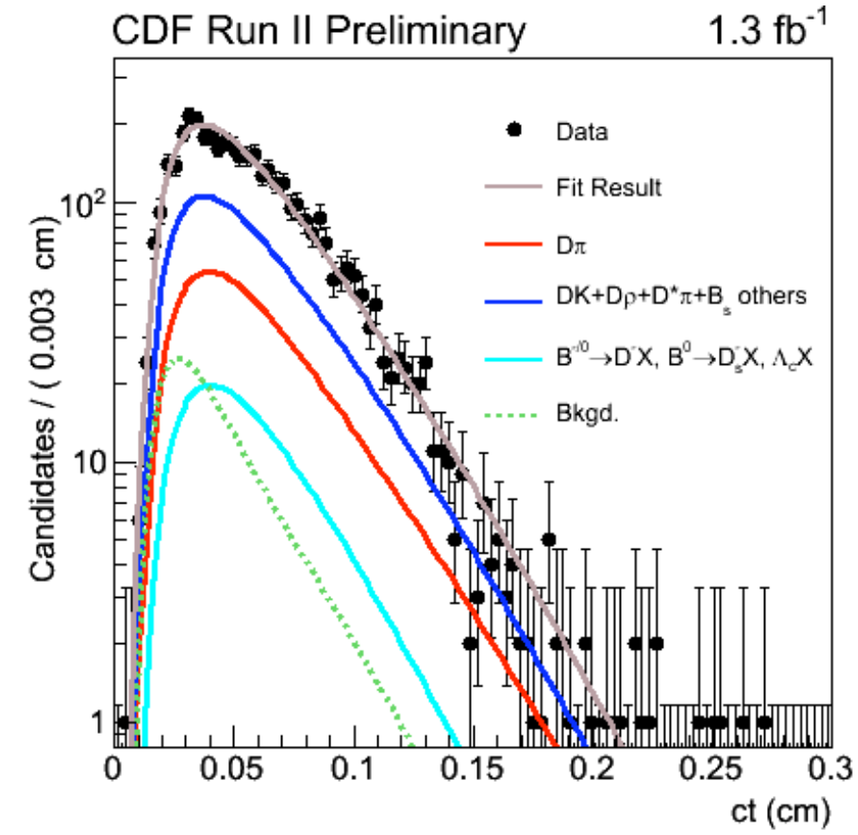
$$\tau(B_s) = 1.518 \pm 0.041 \pm 0.025 \text{ ps}$$

Most precise measurement to date!

Good agreement with recent high precision CDF result

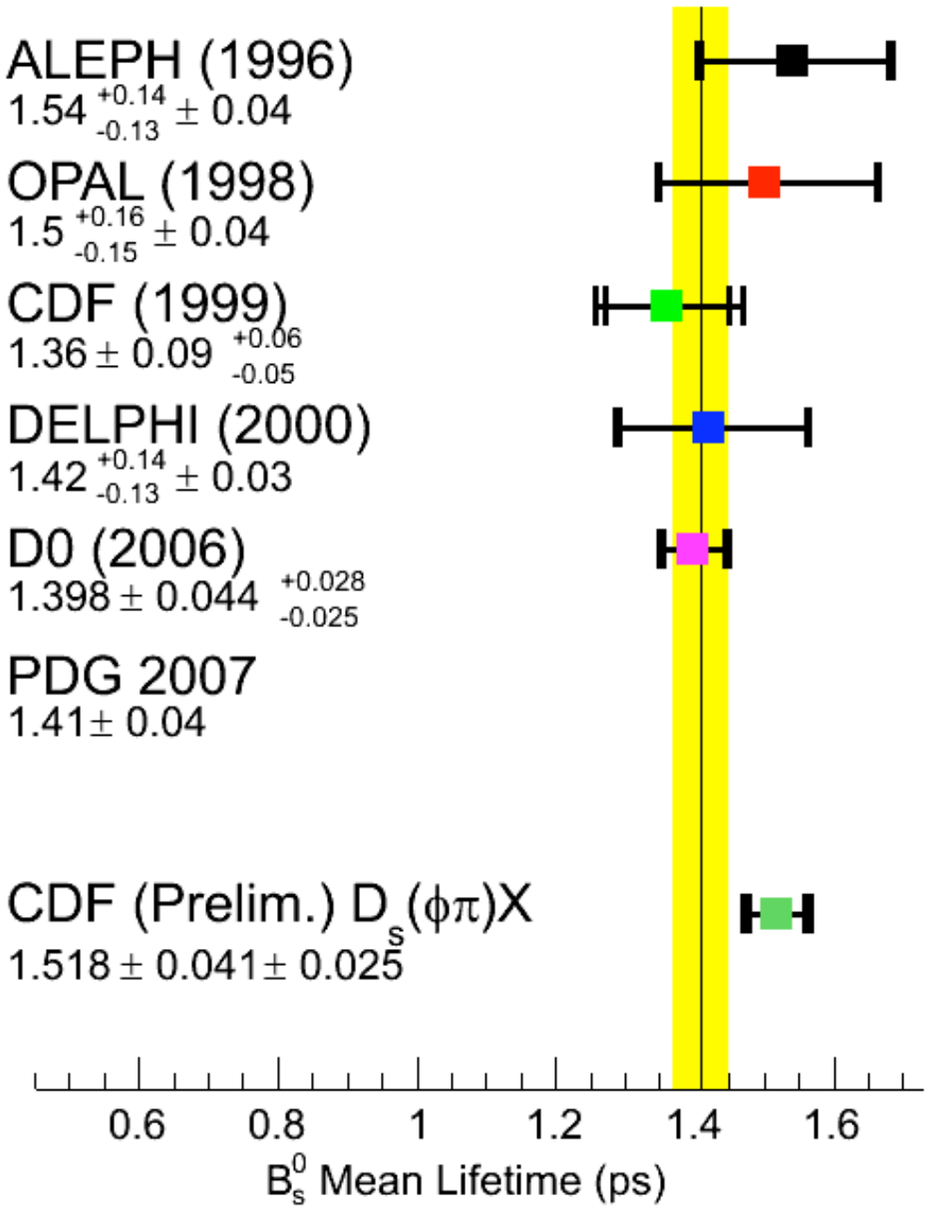
$\tau(B_s)$ $[D_s^-(\phi\pi^-)X]$ / $\tau(B^0)$ [PDG] = 0.99 ± 0.03





Summary

Flavor Specific Measurements



- ✦ Room for experimental input to heavy meson decay predictions
- ✦ Trigger on displaced vertices
  - ➡ large B_s sample
  - ➡ can account for *ct* curve sculpting
- ✦ Increase statistics using partially reconstructed B_s decays
- ✦ Result: Improved experimental uncertainties!
